## **New Massive Sulphide Zone Discovered Near Stewart, B.C.**

Auramex Resource Corp. (the "Company") reports that exploration commenced June 26, 2006 on its 24,000 hectare Bear River Properties near Stewart, B.C.

The main effort of the program to date has been taking stream geochemical samples on a property scale on all of the company's claim blocks. Work at elevations above 1300 metres has been limited by snow cover, so the main target areas at the edge of the glaciers have not been prospected. The first day of ice edge prospecting on the Bear Property on July 14th discovered a pyrite and chalcopyrite massive sulphide zone 20 metres from the toe of a glacier. The showing has not been exposed long enough to oxidize. The massive sulphide horizon is about 0.5 metres thick. The zone trends 110° and is one of a series of like trending mineralized structures present over a 50 metre width. This showing is currently being mapped and sampled in detail.

Another interesting showing has been discovered on the Company's Georgie River property. This showing consists of a 1.1 metre wide vein containing approximately five percent chalcopyrite. Samples have been sent for assay.

Exploration is ongoing, with two helicopter supported prospecting teams working seven days a week. Work on the higher and more prospective areas near the edges of the retreating ice is beginning as the snow melts back. Results will be reported as received.

This release has been approved by the Company's qualified person, David St. Clair Dunn, P. Geo.
